

17. *Hypnea musciformis*

Red, red-brown, orange-brown, often tangled. Branches sparse, wiry, with curved, hook-like tips. The hook tips are flattened while the branches are rounded.

18. *Lomentaria baileyana*

Pink-red, green, to red-purple, tangled and soft. Branches sparse, delicate, uneven, rounded, with tapering, blunt tips.

19. *Sargassum filipendula*

Green, brown-green, to tan. The tough, wiry, stem has few branches, but has regularly spaced long narrow blade-like "leaves" and grape-like, air filled vesicles.

20. *Ulva lactuca*

Green to bright or neon green, soft, and slippery. The lettuce-like structure is thin, ruffled, and delicate. Often occurring in lettuce head-like clumps but can occur as single ruffled layer.

The works of Dawes, Mathieson, and the Littlers were used as references for the algal descriptions. Sources: Dawes C. J., Mathieson C. 2008. The seaweeds of Florida. SEA GRASSES IDENTIFICATION GUIDE

Sea grasses are grass-like flowering plants that live completely submerged in marine and estuary waters. Sea grasses occur in protected bays and lagoons and also in deeper waters along the continental shelf of Florida.

A. *Syringodium filiforme* Manatee Grass

Elongated, cylindrical leaves. Similar to spaghetti.

B. *Thalassia testudinum* Turtle Grass

Elongated, flat blade leaves. Similar to fettuccini pasta.

C. *Halodule wrightii* Shoal Grass

Length usually less than 6", thin, flat blades. Can be distinguished from Manatee Grass by having flat versus cylindrical blades.

Halophila engelmannii Stargrass

These are smaller, more fragile sea grasses. Only limited information about them exists, although surveys are underway to define their ecological role.

What is algae and why is it important?

- Algae are not true plants, but a large and diverse group of eukaryotic (complex-celled) photosynthetic organisms. They provide food and shelter for many aquatic animals including small fish, crabs and shrimp.
- Algae drifting and washing ashore is a natural process.
- Seagrasses are plants and not algae.

How to report an algae event:

- Call 239-745-3052 to report large mats of algae that have washed ashore.
- On the phone recording, report the following information:
 - Where did you find the algae? You may report a close public beach access, address or description of location.
 - Day and time:
 - How much?
 - How large an area is covered by algae?
 - How deep is the algal mat?
- Based on this FGCU Seaweed Identification Guide, state which algae number located next to its photo you believe it to be. You are welcome to offer 2 or 3 best guesses if it helps!!! Please note, sometimes colorful algae will sun bleach to white or opaque.

ALGAE IDENTIFICATION GUIDE

FLORIDA GULF COAST UNIVERSITY

VESTER FIELD STATION

1. *Agardhiella subulata*

Deep red in color, stems are round, slippery, and firm. Branches are pinched or tapered at base and pointed at the tips.

5. *Solieria filiformis*

Pink-red to deep red, bushy, and densely branched. Branches are fleshy, pointed at the tips, and sharply tapered at the base.

9. *Gracilaria mammillaris*

Dark red to red-brown, bushy and tough. The main branches are flattened and strap-like, with tips divided into two or more hornlike sections.

13. *Champia parvula*

Red, red-brown, to brown, delicate, jelly-like, and slippery. The branches are short, slightly flattened or rounded, and covered in band-like constrictions.

2. *Agardhiella ramosissima*

Plant pinkish-red to brown, with very flat, strap-like stems and branches. The smallest branches are rounded and not flattened.

6. *Botryocladia occidentalis*

Red to orange-brown, main stem tough and wiry. Branches covered with oblong, oval shaped, grape like clusters that appear to be filled with air.

10. *Gracilaria tikvahiae*

Red, red-brown, or green-brown with many rounded to partially flattened branches. Branches are delicate, slippery and sharply pointed.

14. *Caulerpa racemosa*

Commonly called "sea grapes". Green in color, distinguished by spherical branchlets ("grapes") arising from a horizontal runner (stolon).

3. *Gracilaria blodgettii*

Red to brownish, with many, rounded, tough, slippery branches. The tips of branches are often very tapered and pointed; older specimen may have blunt tips.

7. *Dasya ramosissima*

Red to red-brown, bushy, fluffy, and soft. Branches are dense, very delicate, and covered with many fine feathery hair like filaments.

11. *Caulerpa sertularioides*

Fern-like, green to light green, branches feather or fern-shaped, and sparse. The main stem of the algae is darker colored, wiry, and tough. The branches are more stretched out and elongated than the *Caulerpa mexicana* variety.

15. *Dictyota cervicornis*

Light green to olive green, densely branched. Branches extend at wide angles from the main stem, are flattened, spiraled, and have branching antler-like tips.

4. *Eucheuma isiforme*

Gold, red, or red-brown. Branches are sparse, tough, firm and cartilaginous. The main stem of the plant is often wider or swollen at the base.

8. *Acanthophora spicifera*

Sandy to red-brown with few branches. Branches are rounded and covered with spiny, spur-like projections.

12. *Caulerpa mexicana*

Green to light green, delicate, creeping plant. Branches fern or feather-shaped shorter and more compressed than *Caulerpa sertularioides*.

16. *Hincksia mitchelliae*

Deep red in color, stems are round, slippery, and firm. Branches are pinched or tapered at base and pointed at the tips

If you have any information about algae washing up on the beach, call this number: 239-745-3052. Please report the types of algae seen, (according to this guide) as well as, date, time, general location, and approximate size of the algae event.
